

Arctic fish catch bigger than thought

REUTERS FEBRUARY 5, 2011

The amount of fish caught in the Arctic has been dramatically under-reported for decades, making the northern ocean environment appear far more pristine than it really is, according to a study.

An estimated 950,000 tonnes of fish were caught in Russian, Canadian and U.S. Arctic waters between 1950 and 2006, which is 75 times higher than reported by the United Nation's agency that records catch levels, according to Canadian researchers.

Ineffective reporting "has given us a false sense of comfort that the Arctic is still a pristine frontier when it comes to fisheries," lead researcher Dirk Zeller of the University of British Columbia said in a written statement.

The results of the study were published this week in the journal *Polar Biology*.

The researchers said they collected data on fish catches from a variety of sources in the region, including those kept by indigenous people, and compared it to what was reported to the U.N.'s Food and Agriculture Organization.

The researchers estimate between 1950 and 2006 89,000 tonnes of fish were caught in Alaskan coastal waters and 94,000 tonnes in Canadian waters, but neither Canada nor the United States supplied that data to the U.N.

An estimated 770,000 tonnes of fish were caught in Russian waters off Siberia, above the 12,700 tonnes reported by the United Nations, according to the study.
